PRINCIPLES AND PROGRAM OF THE SHERPAS LAB

The approach adopted by the SHERPAS Lab since its foundation in 2002 promotes dialogue between disciplines of sociology, history, psychology and physiology, and respect for each other's academic practices. These scientific approaches shape the identity of the SHERPAS Lab and place it at the intersection of science and technology of physical sports activities and social sciences. For a quarter of a century, the lab has been committed to studying sports as a scientific topic as well as a social construct. In 2018 a new scientific program was launched, with the goal to interpret the use of the body in the context of physical and sports activities (PSA) and of physical and sports education (PSE), within the framework of the reconstruction and disintegration of social belonging. Our studies aim to examine whether PSA and PSE affect the construction or the consistency of the recognition and protection of the personal and social identities and if so, to what extent.

We study these relationships from the opposite perspective: we also seek to know how the isolation of individuals, the threatened cohesion of society, and the decline of institutions can influence the APS and the EPS. During our research carried out in various contexts and fields, the focus shifted to situations where physical, social, economic, psychological vulnerabilities are detectable. Through adopting multidisciplinary scientific approaches, the conscious use of materials and measures, and being aware of the limitations of these research tools, the lab members carry out high quality research of vulnerabilities. This program is completely in line with the third strategic pillar of Artois University.

THE SPORTS CULTURES COLLECTION

The Cultures Sportives collection was published in 2002. It is built on the contextualization and theoretical interpretation, the establishment of historical and sociological constructs by using empirical methods, and the highlighting of processes and ruptures by the authors. It thus explores the links between history, sociology and other social and human sciences (anthropology, ethnology, geography and psychology) through pioneering works in methodology and social objects. The themes introduced are in the main stream of the current scientific program of the SHERPAS Lab. Since 2018, focusing on vulnerabilities, it has been devoted to the interpretation of the use of the body in the context of physical and sports activities, in the context of physical and sports education and in the framework of the reconstruction and disintegration of social belonging. Consequently, the publications are inherent parts of the Third Strategic Pillar of Artois University ("Reconstruction of social belonging: measurement, interpretation and intervention"). The collection is open to researchers in France and abroad. Two divisions were developed to promote new books: "Terrains" and "Essais libres". The first includes long studies, habilitation thesis books, thematic dictionaries, summaries and collective works. The second supports sports specialists who are not members of the scientific community such as elite athletes, documentarians, prison sports instructors, retired physical education and sports teachers and actors.
